

Electrical Insulating

RUBBER TAPES

Electro Tape
Since 1969

Low Voltage

High Voltage

Filler Tape

Rubber tapes are designed for use in electrical insulating and moisture sealing applications for new wire and cable splices or wire connections under repair.

They utilize various rubber formulations that exhibit self-fusing (amalgamating) properties so that these tapes bond quickly to themselves and around the substrate to form a void-free, solid mass of protection and insulation.

Low voltage rubber tapes rated for up to 600V, high voltage rubber tapes rated through either 35 kV or 69 kV depending on the specific application.

Please consult individual Product Data Sheets for full product specifications and application suitability.

Contact ETS main office or your sales rep for more details!

- **Self-fusing (Self-amalgamating) feature provides void-free, moisture free splice and seal build-up.**
- **Excellent physical, electrical and mechanical properties.**
- **Able to withstand expansion and contraction challenges.**
- **Compatible with common, solid cable and wire insulations.**
- **3/4" thru 2" widths most common. Custom widths are also available.**

Series	Thickness / Rubber Type	Features
40 Low Voltage	30mil EPR	Designed for primary insulation of electrical wires and splicing of cables for Low Voltage. Suitable for general electrical, construction, and industrial applications: service drops, ground rod connections, motor leads, pipe repair, etc. <i>Made in USA.</i>
43L High Voltage	30mil EPR	Lined material suitable for High Voltage: Jacketing on splices and terminations, bus bar insulations, building stress cones on cables etc. <i>Made in USA.</i>
43SW High Voltage	30mil EPR	Linerless material designed for the same High Voltage applications as our 43L product. Linerless feature allows for quicker application.
125 Elec. Filler	125mil Butyl	Designed for cost effective insulation build-ups in conjunction with other rubber or vinyl insulating tapes. <i>Made in USA.</i>
